Oscillating axle

The AX range machines have an active oscillating axle hydraulically controlled that re-balance through a level valve in the center of the axle. This ensures all 4 wheels remain on the ground during work on uneven ground.

Max load limiting device

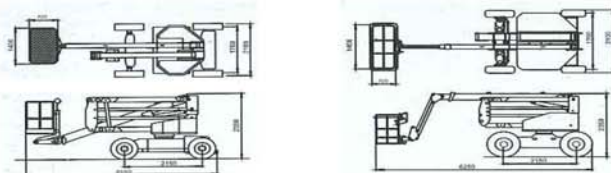

The cage has a mechanical load limiting device to avoid overloading of the cage and increase safety.

Two Inclinometers

We take care to ensure the safety of our platforms. Two inclinometers control that the platform does not exceed the 5° gradeability in any part of its structure.
